# DigiHeal

Advancing telemedicine with a mobile health app's integrated risk calculator

What we did:

## Client

A leading telemedicine provider aimed to enhance its mobile health application by integrating a real-time risk assessment calculator. The goal was to equip healthcare professionals and patients with predictive analytics for better decision-making while ensuring a seamless user experience.

## Category

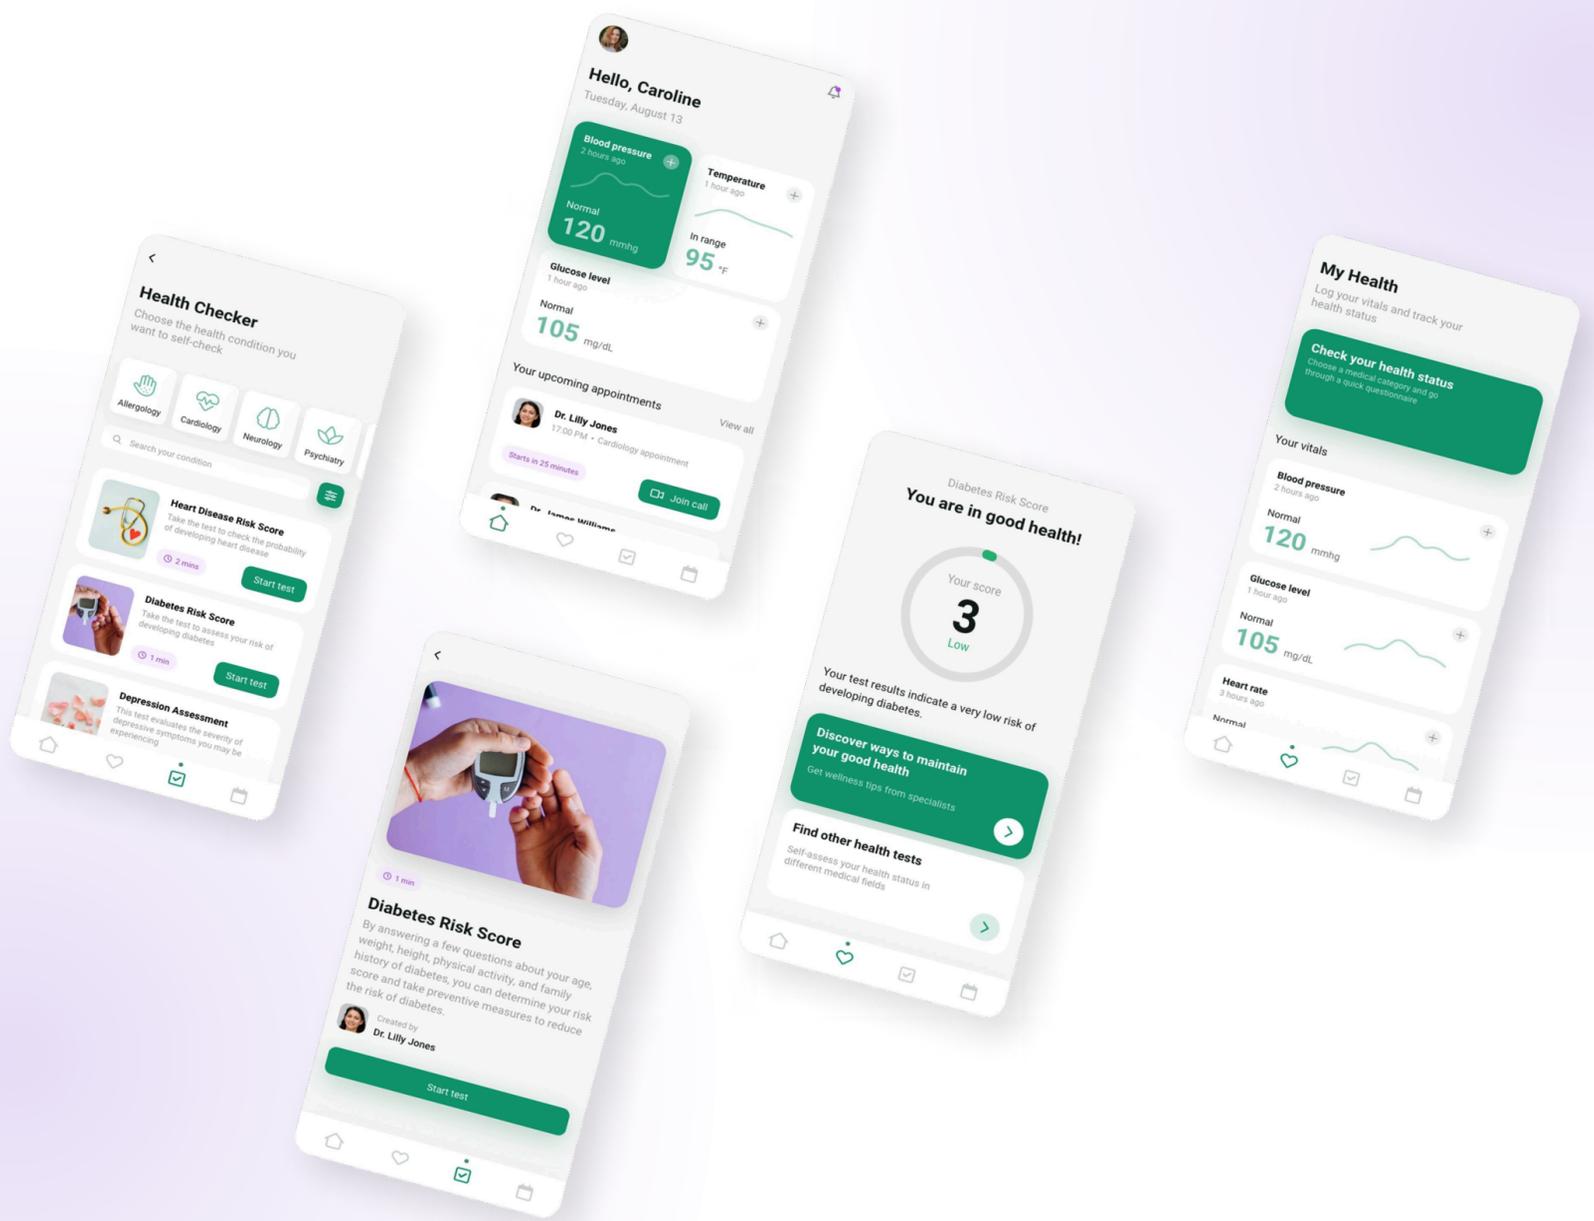

- Telemedicine
- Mobile health
- Health data analytics

## Duration

4 months

## Team

2 UX/UI designers  
3 Software engineers

[Watch the demo →](#)

## Problems

The existing telemedicine platform lacked an integrated risk calculator, forcing users to rely on external sources for critical health assessments. This led to inefficiencies, delays, and a disjointed user experience. The challenge was to develop a high-performing risk assessment tool that worked in real time, adhered to strict healthcare compliance standards, and integrated seamlessly into the existing system.

## Solution

- ✓ **UX/UI design:** Crafted an easy-to-use, intuitive interface to ensure effortless interaction with the risk calculator while maintaining consumer-grade, Wizard-like app experience.
- ✓ **Mobile app development:** Built the calculator module using Java for Android and Swift for iOS, ensuring smooth performance on both platforms.
- ✓ **Backend development & API integration:** Developed a scalable backend using MongoDB for data storage and a REST API to facilitate real-time communication between the app and external healthcare systems.
- ✓ **Data processing & performance optimization:** Ensured fast and secure data retrieval with optimized API calls and efficient data handling, providing real-time risk assessments without lag.
- ✓ **Compliance & Security:** Ensured that the app adhered to strict healthcare regulations, integrating secure data handling measures while maintaining performance and usability.

# Bloom - results report

Global health organization showcases its impact with an interactive mobile platform

## What we did:

UX/UI design

Data visualization

## Client

Our client, a global health organization committed to promoting well-being, protecting public health, and supporting vulnerable communities, needed a digital solution to showcase its measurable impact worldwide. The goal was to provide a seamless, engaging, and accessible way for global audiences to explore key health initiatives, emergency response efforts, and progress toward universal health coverage.

## Category

Data visualization

Public health tech

## Duration

4 months

## Team

2 UX/UI Designers

2 Software engineers

[Watch the demo →](#)

## Problems

The client needed a mobile-friendly, interactive platform to communicate global health impact in a clear, engaging, and data-driven manner. Existing reporting methods were static and less accessible, limiting engagement from policymakers, researchers, and the public. The platform needed to support multiple languages, work seamlessly across devices, and ensure high performance and accessibility.

## Solution

- ✓ Developed a modern, interactive mobile app to present health impact dynamically.
- ✓ Designed an intuitive UX/UI to enhance engagement and readability.
- ✓ Implemented offline access, allowing users to explore content anytime.
- ✓ Optimized for high performance across devices and screen sizes.
- ✓ Integrated multi-language support to increase global accessibility

## Does this challenge sound familiar?

Let's see how we can help! We'd love to share solutions we've designed and developed for other healthcare clients.

# COVID-19 Dashboard

Strengthening pandemic response with real-time data visualization

## What we did:

- UX/UI design
- Data visualization
- Web application development

## Client

During the COVID-19 pandemic, we collaborated with policymakers, researchers, and public health organizations to develop a real-time data visualization dashboard. The goal was to provide accessible and up-to-date information on virus morbidity, recovery rates, and geographical spread.

## Category

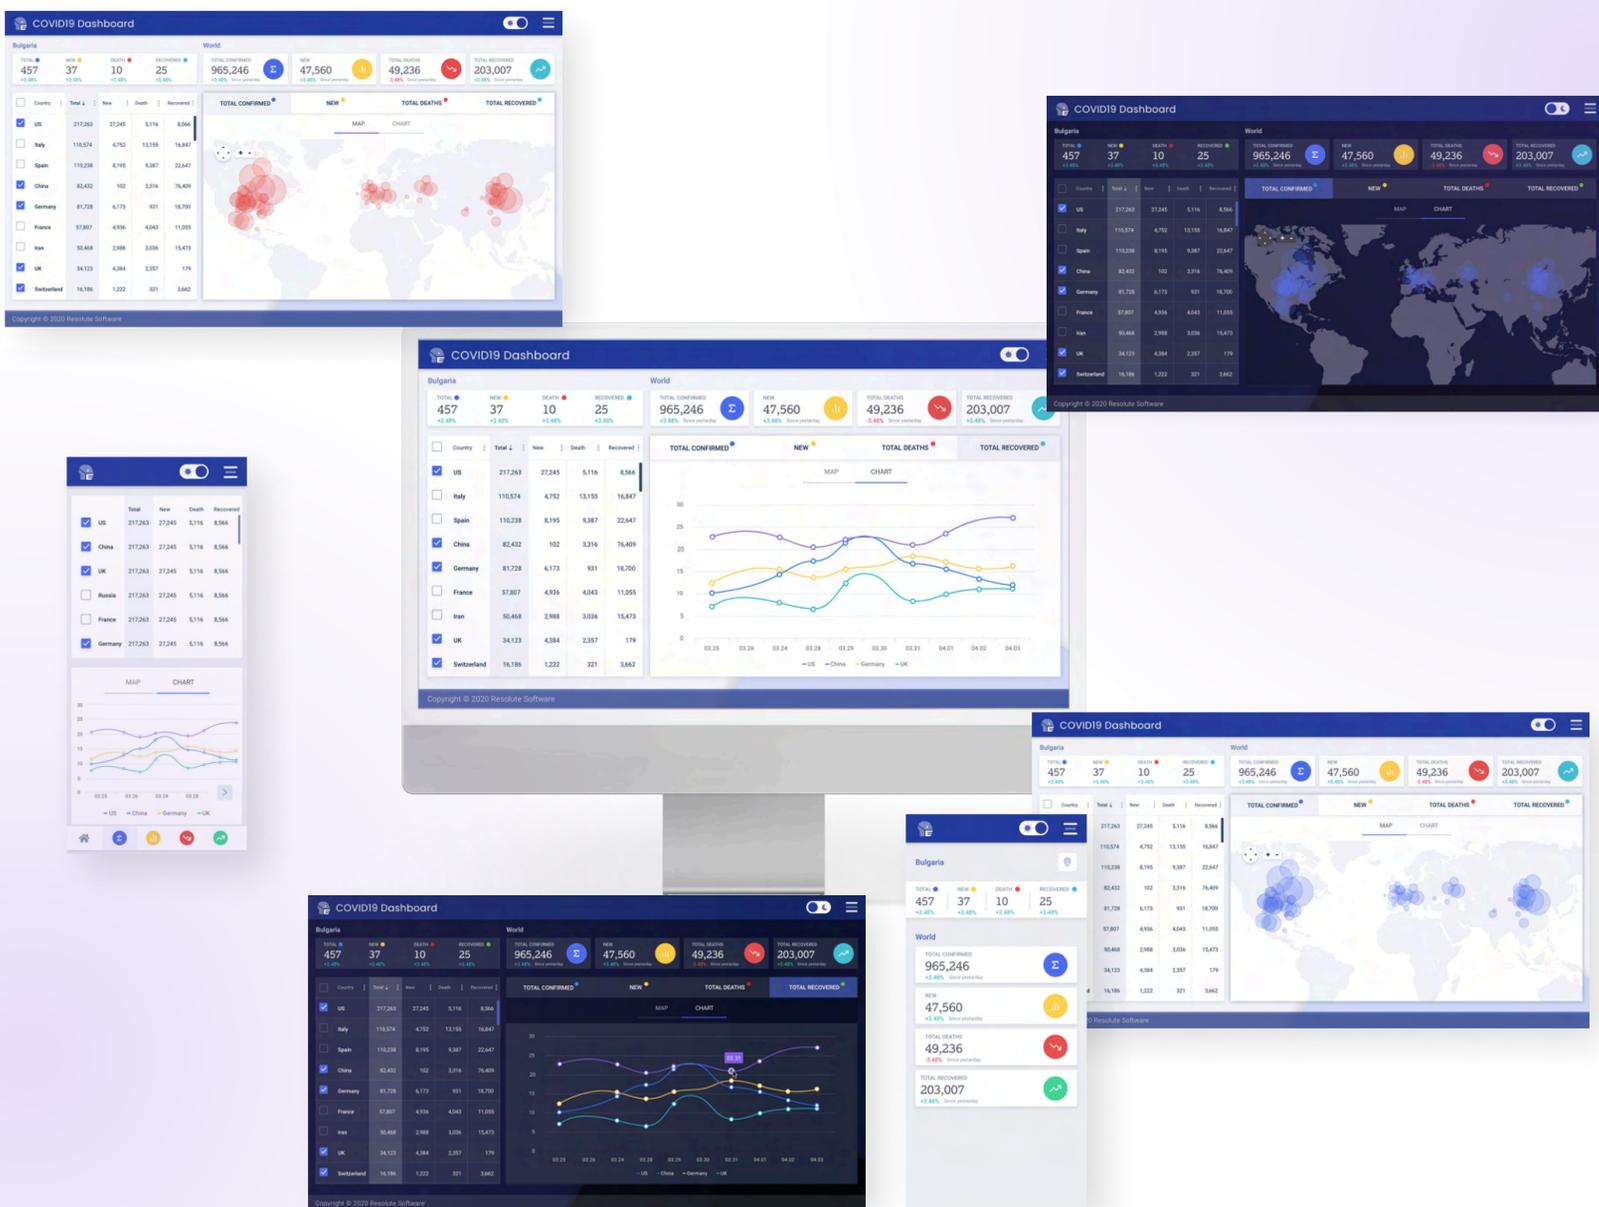

- Data visualization
- Public health tech

## Duration

6 weeks

## Team

2 UX/UI designers  
3 Developers  
1 Data engineer

[Watch the demo →](#)

## Problems

At the onset of the pandemic, reliable, real-time data on COVID-19 cases, recoveries, and fatalities was scattered across multiple sources, making it difficult for decision-makers, healthcare providers, and the public to assess the evolving situation. A unified, intuitive, and visually compelling solution was needed to streamline information and enable data-driven decision.

## Solution

- ✓ Designed an interactive dashboard with real-time data visualization, allowing users to track COVID-19 cases by country, region, and worldwide.
- ✓ Implemented a map-based UI using Angular that provided an intuitive overview of hotspots and trends using geospatial data.
- ✓ Developed an easy-to-navigate table view to display key statistics, including confirmed cases, deaths, and recoveries, ensuring accessibility for both experts and the general public.
- ✓ Optimized performance to ensure fast loading speeds and seamless interaction across devices.

## Need to make sense of complex data in real time?

Let's explore how our expertise in data visualization and web applications can help you turn total data into actionable insights. Get in touch to see how we've tackled challenges like yours!

# Cloudistic

Modernizing SaaS platform for a fintech solutions provider

## What we did:

UX/UI design

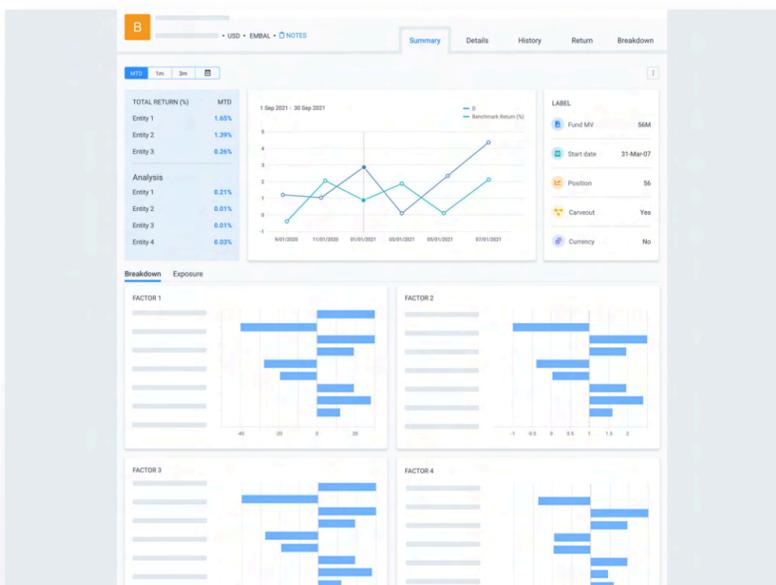

Web development

Data augmentation

## Client

A cloud-based FinTech solutions provider that delivers advanced analytics tools for asset managers, portfolio managers, and risk analysts. With over a decade in business and offices in Europe and North America, the company serves some of the world's top financial institutions, empowering fund managers to make better investment decisions through data-driven insights.

## Category

FinTech solutions

SaaS

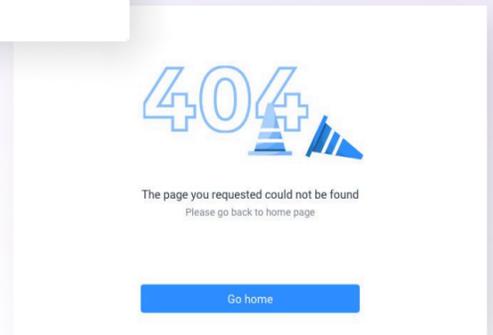

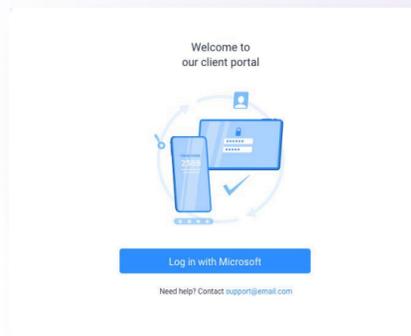

Rich data visualization

## Duration

5 months

## Team

2 UX/UI designers  
2 Software engineers

The table has columns for 'Description', 'Index', 'Currency', 'Latest update', 'Status 1M', 'MTD', '1M', and '3M'. It is organized into sections for 'Entity 1', 'Entity 2', and 'Entity 3'.

This is a light-themed version of the data table shown in the previous image, with the same columns and structure.

[Watch the demo →](#)

## Problems

The client's legacy platform required a modernized user experience and an upgraded technology stack to improve security, flexibility, and scalability. Their key goals included:

- ✓ Enhancing data security & visualization.
- ✓ Maintaining core platform functionality while incorporating modern technologies.
- ✓ Ensuring a seamless transition for end users without disrupting workflows.

With a tight three-month deadline and a small internal team, the company sought external expertise to complete the project efficiently.

## Solution

Resolute Software collaborated closely with the client to redesign and modernize their FinTech SaaS platform while ensuring smooth adoption of new technologies.

- ✓ UX/UI Redesign: Created an intuitive, modern interface that enhances usability without disrupting familiar workflows.
- ✓ Technology Upgrade: Migrated from ASP.NET WebForms to a modern front-end framework (Angular) based on Resolute's recommendations.
- ✓ Data Management & Augmentation: Developed a high-performance data grid capable of handling 30,000+ records with advanced filtering, sorting, and drill-down capabilities.
- ✓ Security Enhancements: Integrated Microsoft Azure Active Directory for improved access control and authentication.

Ready to modernize your platform?  
Let's see how we can help.

# LockSiem

Enhancing cybersecurity intelligence with a real-time threat monitoring dashboard

What we did:

- UX/UI design
- Web application modernization
- Data-heavy interactive dashboard

## Client

Our client, a cybersecurity-focused organization, is dedicated to enhancing IT security processes through cutting-edge technologies. They provide solutions that safeguard sensitive data, prevent breaches, and ensure compliance with industry regulations.

## Category

- Security and compliance
- Data visualization

## Duration

2 months

## Team

2 UX/UI designers  
2 Software engineers

[Watch the demo →](#)

## Problems

The client needed a high-performance security event monitoring system capable of handling vast amounts of data in real-time. Their key challenges included:

- ✓ Real-time threat monitoring – Ensuring security logs were continuously updated and accessible without delays.
- ✓ Scalable data processing – Managing large-scale event tracking while maintaining speed and reliability.
- ✓ Advanced analytics & compliance – Providing interactive dashboards with deep filtering and visualization for security audits.

## Solution

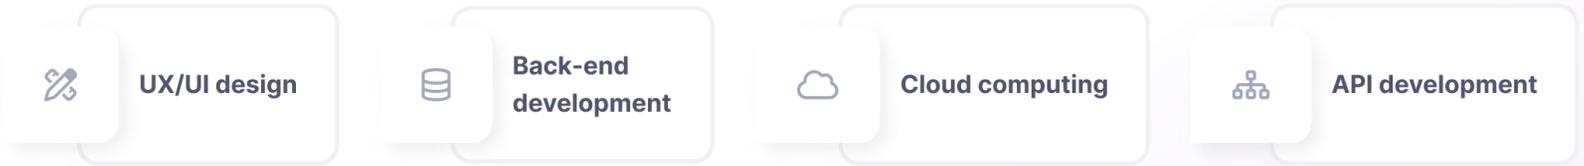

- ✓ Real-time updates using SignalR for instant data propagation to the dashboard.
- ✓ Designed an intuitive UX/UI to enhance engagement and readability.
- ✓ Implemented offline access, allowing users to explore content anytime.
- ✓ Optimized for high performance across devices and screen sizes.

Let's build a smarter, faster, and more secure solution for your evolving cybersecurity needs. [→](#)

# Desktribe

Developing the virtual workplace of tomorrow for customer service representatives

## What we did:

## Client

A large, global customer experience (CX) technology and services innovator, who provides end-to-end, digital CX solutions and operational CX orchestration through a proprietary, cloud-based CX-as-a-Service (CXaaS) platform, aimed to overcome the barriers of working from home and improve CX at every virtual interaction and customer touchpoint throughout the customer journey.

## Category

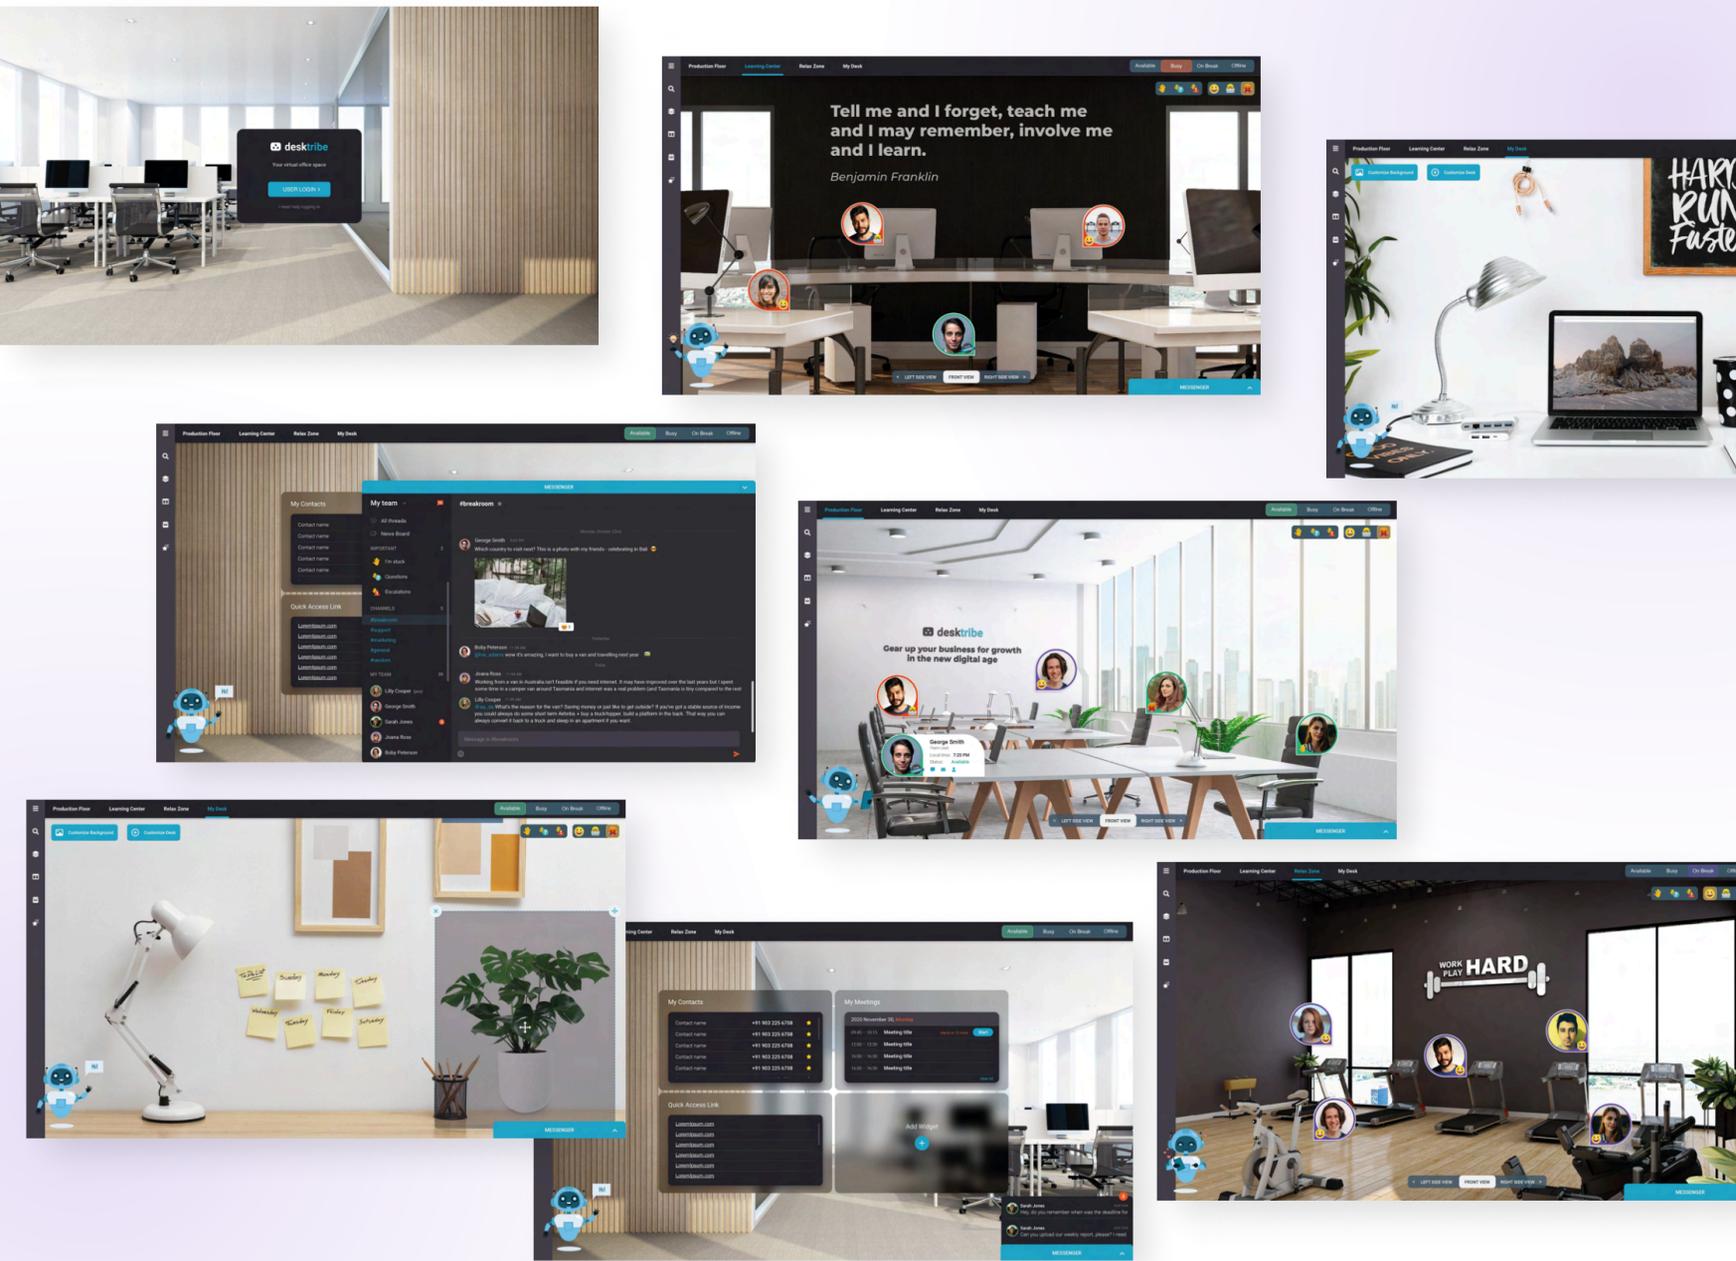

- Virtual collaboration
- Digital workspace

## Duration

6 months

## Team

2 UX/UI designers  
6 Software engineers

[Watch the demo →](#)

## Problems

The client, serving global brands, required efficient collaboration among customer service reps for real-time customer support. The team had to juggle multiple systems, hindering collaboration and service quality. The organization needed **a robust full-stack development team** to design a unified platform that provided seamless access to all the tools contact center employees use in their daily workflow. Additionally, they wanted their employees to feel happy and motivated at work by offering them a visually stimulating UX experience.

## Solution

- ✓ Designed an immersive, graphically rich, easy-to navigate and engaging virtual collaboration platform, enabling real-time interaction for remote teams in a 3D workspace.
- ✓ Developed customizable avatars, desks, and real-time availability tracking.
- ✓ Integrated chatbot, email widget, and escalation channels for seamless communication.
- ✓ Optimized the UX, reducing scrolling by 30% for improved usability.
- ✓ Launched the first production-grade version for 600 users, potentially scaling to 25,000 concurrent users globally.

## Struggling with disconnected systems and collaboration challenges?

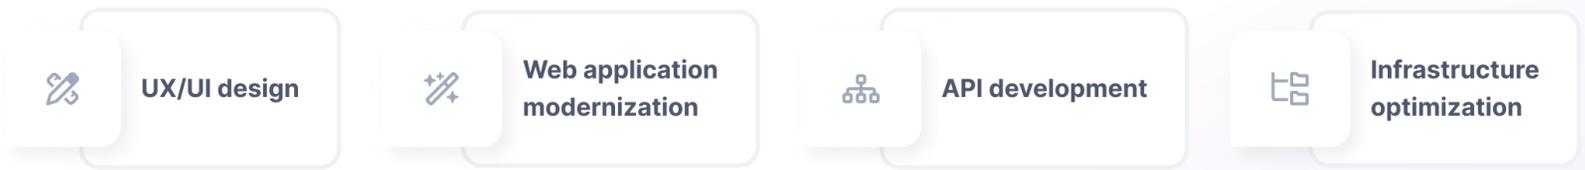

Let's explore how a seamless, user-friendly digital experience can transform your workflows, enhance team efficiency, and elevate customer satisfaction.

# Sonik

Optimizing logistics efficiency with a modernized office locator solution

## What we did:

## Client

Our client, a leading international logistics company, needed to modernize its office locator functionality to improve efficiency and provide seamless experience for customers looking for nearby service points. The goal was to create a centralized, high-performance API that could serve multiple digital platforms, including the company's mobile app and website.

## Category

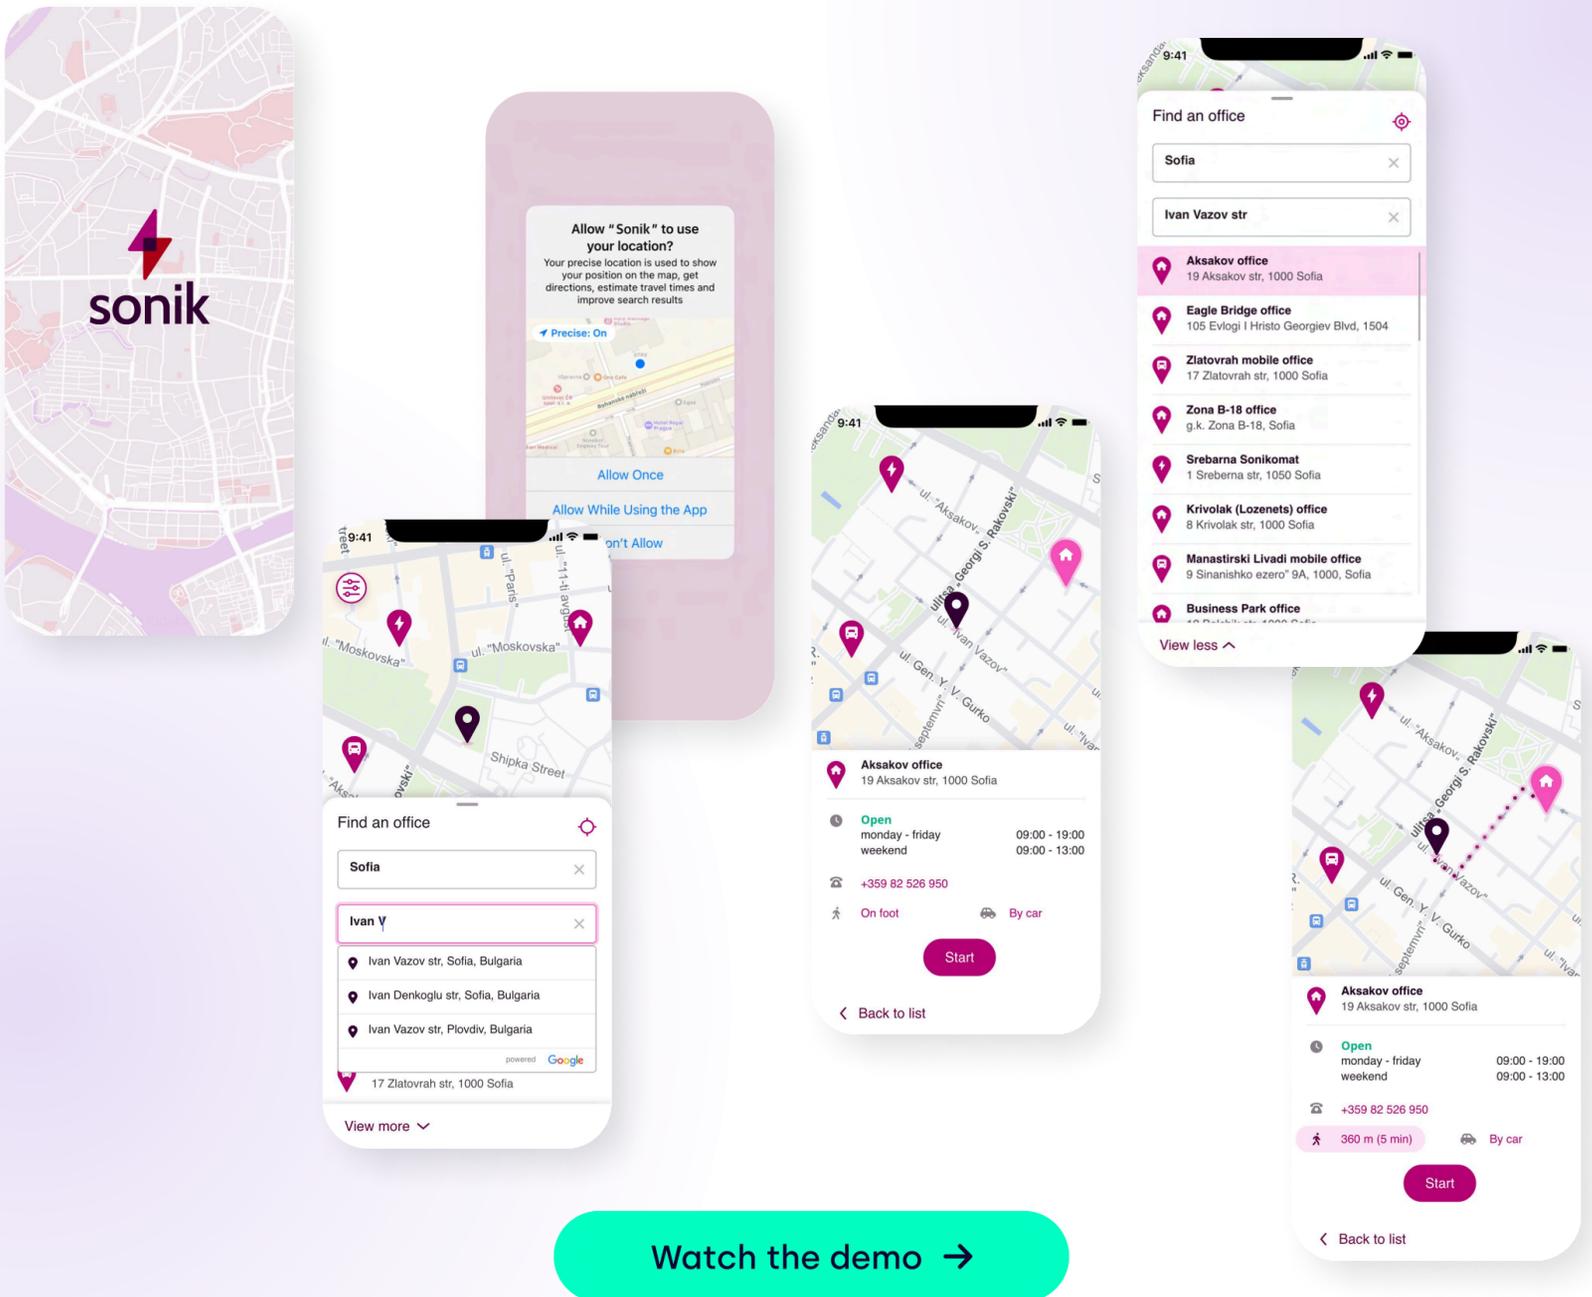

- Logistics and supply-chain tech
- Geo-location services
- API and infrastructure modernization

## Duration

4 months

## Team

2 UX/UI designers  
2 Software engineers

[Watch the demo →](#)

## Problems

The existing office locator functionality relied on separate backend infrastructure, making it complex to maintain and scale. Office search relied on Elasticsearch-based geo-location queries, requiring additional infrastructure and increasing operational costs. The system lacked a centralized API, making it difficult to integrate the locator across multiple platforms.

## Solution

- ✓ Developed a unified geo-location API, making office search functionality accessible across mobile and web platforms.
- ✓ Optimized database queries using spatial indexes for faster, more efficient office searches.
- ✓ Eliminated the need for redundant backend infrastructure, significantly reducing complexity and costs.
- ✓ Enabled seamless integration with the company's existing ERP and digital platforms.
- ✓ Designed the solution to support future expansion, including web widgets for third-party integrations.

## Struggling with fragmented systems and high operational costs?

Let's build a seamless, scalable digital solution that enhances efficiency, reduces complexity, and delivers a frictionless experience across all platforms.
